Happy Ground Hog's Day! It looks like I have completely stopped releasing open source project lately. Hopefully I can get back on track.

More than a year after **releasing DataMgr 2.5 Beta 2**, I am finally releasing DataMgr 2.5 Beta 3. So, what took so long? Neglect, basically. I have just been busy with other things.

Even so, I think this is a very good release and should be a close match for the final release of version 2.5.

(**What is DataMgr?**)

So, what is new in DataMgr 2.5 Beta 3 (since **Beta 2**)?

- "**hasRecords**" method for efficient checking of existence of records matching criteria.
- Ability to **migrate fields** - moving old data to new field names. Handy for renaming fields or easy migration from many-to-one relationship to a many-to-many one.
- SQL Server: Added support for varchar(max) (and made it the default for LONGVARCHAR).
- Ability to **check for table existence**.
- Documentation for "**ftable**" attribute.
- A few bug fixes.

Feel free to download **DataMgr 2.5 Beta 3** (zip) or use the **repository** for the Bleeding Edge Release. For the latest full release, use the **DataMgr RIAForge** page. DataMgr is open source and free for any use.
