

Can I Play on Your Database?

With the release of the [second Alpha of DataMgr 2.2 \(What is DataMgr?\)](#), I am nearing feature completion for that version. What I would like to do now is add support for more databases. If you have wanted to take advantage of DataMgr, but you are using a database that isn't currently supported by DataMgr, then [let me know](#).

If you can give me access to a database on your DBMS, that would be even better. I only need enough access to set up a datasource on my local box to point to a database running on your DBMS (with CREATE rights). I will do my best to add support for any relational database to which I can get access.

The current build of DataMgr currently supports the following databases:

- Apache Derby
- MS Access
- MS SQL Server
- MySQL
- PostGreSQL

With your help, I can hopefully add support for more databases before the final release of DataMgr 2.2.
