Neptune Beta 1.5

Two weeks ago, I **launched the initial beta** of my **Neptune framework**. As I am prone to do, I missed something obvious in the released files (failing to include a needed file), causing the example in the documentation not to work. Tom Hubbard was nice enough to point this out to me.

In addition to that, my CF-Talk **announcement**, generated quite a discussion on the security of file uploads in Neptune. Consequently, I have made some adjustments in response to that discussion.

I felt these to changes were significant enough that I wanted to get them out right away, but not significant enough to call this release "Beta 2", so I punted and called it "1.0 Beta 1.5" - kind of a lame version number, but oh well.

For file upload security, I did the following:

- Added a file.cfm that can serve up uploaded files securely (using CFCONTENT)
- Changed a default setting so that files are served up by file.cfm by default (I may change this back, however).
- Added a page about **file uploads** in the **documentation**.
- Added notes to the **installation page** recommending storing files outside of the web root.

As always, I would love to hear any comments or suggestions

Neptune is open source and free for any use.
