It has been nearly a year since I [released CodeCop 1.0](#) and I have to admit that I haven't worked on it much since. This new release is primarily to integrate better into the ColdFusion 8 administrator. When installed in the ColdFusion 8 administrator, it will match the styling of that administrator.

I also added support for Apache Derby by upgrading to DataMgr 2.2 (Alpha 2).

I am still working on my feature list for CodeCop 2.0, so if you have any ideas for that version, [let me know](#).

[CodeCop](#) can be downloaded from [RIAForge](#) and is still open source and free for any use.
